

Description

[Colorant Removal from Polymeric Fibers]

BACKGROUND OF INVENTION ARTICLES PRODUCED FROM VIRGIN POLYMERS ARE TYPICALLY COLORED FOR BOTH PRACTICAL AND AESTHETIC REASONS. POLYOLEFIN FIBERS AND ARTICLES OTHER THAN FIBERS TYPICALLY HAVE COLORANTS DISPERSED THROUGHOUT THE POLYMERIC MATERIAL BY A PROCESS OF ADDING THE COLORANT TO THE MOLTEN POLYMER. POLYESTER, NYLON 6, AND NYLON 6,6 FIBERS ARE TYPICALLY COLORED BY DYEING THE SURFACE OF THE ALREADY-FORMED FIBERS USUALLY IN AN AQUEOUS MEDIUM. ONE SIGNIFICANT LIMITATION TO THE UTILITY OF RECYCLED POLYMER DERIVED FROM POST-CONSUMER FIBERS IS THE COLOR DIFFERENCE BETWEEN VIRGIN POLYMER AND RECYCLED POLYMER. THE DYES ON THE SURFACE OF RECYCLED POLYMERIC FIBERS MAY SIGNIFICANTLY DECREASE THE SUITABILITY OF THE CONSTITUENT POLYMER FOR REUSE BECAUSE COLOR IS NOT NECESSARILY REMOVED DURING CONVENTIONAL RECYCLING PROCESSES. A PROCESS DIRECTED TO THE REMOVAL OF SURFACE COLORANTS IS APPLICABLE ONLY TO CERTAIN POLYMERIC FIBERS. HOWEVER, SUBSTANTIAL QUANTITIES OF NYLON 6 AND NYLON 6,6 POLYAMIDE FIBERS FROM POST CONSUMER CARPET ARE POTENTIALLY AVAILABLE FOR RECYCLE. APPROXIMATELY 40% OF THE FACE FIBERS IN POST RESIDENTIAL CARPET WASTE IN THE UNITED STATES

IS SURFACE DYED NYLON 6, WHILE ANOTHER 40% IS SURFACE DYED NYLON 6,6. PROCESSES FOR STRIPPING DYES FROM FABRIC INCLUDE U.S. PATENT 4,227,881 (FONO) WHICH DISCLOSES A PROCESS FOR STRIPPING DYES FROM TEXTILE FABRIC INVOLVING HEATING AN AQUEOUS SOLUTION OF AN AMMONIUM SALT, A SULFITE SALT AND AN ORGANIC SULFONATE, SUCH AS SODIUM HYDROXYMETHANE SULFONATE, TO AT LEAST 60 DEGREES CELSIUS AND ADDING THE DYED FABRIC TO THE HEATED SOLUTION WHILE MAINTAINING THE TEMPERATURE OF THE SOLUTION. AMONG OTHER DISADVANTAGES, THIS PROCESS IS BELIEVED TO RESULT IN LESS THAN SATISFACTORY COLORANT REMOVAL. U.S. PATENT 4,783,193 (PENSA) TEACHES A PROCESS FOR STRIPPING COLOR FROM SYNTHETIC POLYMER PRODUCTS BY CONTACTING THE COLORED POLYMER WITH A CHEMICAL SYSTEM INCLUDING UNSTABLE AQUEOUS DISPERSIONS OF ALKYL HALIDES AND SOLUTIONS OF BLEACHING/OXIDIZING AGENTS TO WHICH SPECIFIED QUANTITIES OF ACIDS AND SURFACTANT/WETTING AGENTS ARE ADDED. THE USE OF THIS CHEMICAL SYSTEM MAY RESTRICT THE RECYCLABILITY OF THE DECOLORIZED POLYMERIC MATERIALS. U.S. PATENT 5,989,296 (PATTON) TEACHES A PROCESS FOR REMOVING INDIGO DYE FROM DENIM SCRAP BY EXTRACTING THE FABRIC WITH AN ORGANIC SOLVENT SUCH AS 1,1,2-TRICHLOROETHANE IN WHICH THE INDIGO DYE IS SOLUBLE AT ELEVATED TEMPERATURES, THE SOLVENT IS COOLED AND EXTRACTED WITH AN AQUEOUS PHASE CONTAINING A REDUCING AGENT, AND THE AQUEOUS PHASE IS TREATED TO OXIDIZE AND RECOVER THE INDIGO DYE. THIS PROCESS IS APPLICABLE ONLY TO INDIGO DYES. U.S. PATENT 6,083,283 (BERKSTRESSER, IV) TEACHES A PROCESS FOR REMOVING COLOR AND EXTRACTING DYES FROM POLYMERIC MATERIALS BY CONTACTING THEM

WITH A SWELLING AGENT UNDER CONDITIONS SUCH THAT THE SWELLING AGENT INTERRUPTS THE MOLECULAR FORCES WITHIN THE POLYMER MATRIX AND OPENS THE POLYMER STRUCTURE SUFFICIENTLY TO REMOVE NATURAL AND SYNTHETIC PIGMENTS DISPERSED THROUGHOUT A POLYMERIC ARTICLE. THUS, THIS PROCESS MAY HAVE WIDE APPLICABILITY FOR COLORED POLYMERIC ARTICLES OTHER THAN SURFACE DYED FIBERS. THE USE OF SWELLING AGENTS WHICH PENETRATE THROUGHOUT THE POLYMER MATRIX TO REMOVE SURFACE DYES IS UNDESIRABLE BECAUSE COMPLETELY REMOVING THE SWELLING AGENTS AFTER DECOLORIZATION OF THE FIBER WOULD BE EXPECTED TO INVOLVE MORE EXTENSIVE WASHING THAN NECESSARY FOR REMOVAL OF A NON-SWELLING COLORANT REMOVAL AGENT. THUS AN UNMET NEED EXISTS FOR A COST-EFFECTIVE AND ENVIRONMENTALLY FRIENDLY PROCESS FOR REMOVING SURFACE COLORANT FROM SYNTHETIC POLYMERIC FIBERS WITHOUT DEGRADING THE CONSTITUENT POLYMER, OR OTHERWISE COMPROMISING THE POLYMERIC MATERIAL'S SUITABILITY FOR RECYCLING AND RE-USE. THIS UNMET NEED EXISTS PARTICULARLY FOR A PROCESS TO REMOVE SURFACE COLORANTS FROM THE NYLON 6 AND NYLON 6,6 COMPONENTS OF POST-RESIDENTIAL WASTE CARPET. A PROCESS THAT CAN BE CONDUCTED AT ATMOSPHERIC PRESSURE IS MOST ATTRACTIVE.

[0001]

SUMMARY OF INVENTION THE PRESENT INVENTION IS DIRECTED TO A COST-EFFECTIVE AND ENVIRONMENTALLY FRIENDLY PROCESS FOR REMOVING SURFACE STAINS AND DYE-IMPARTED COLOR FROM COLORED POLYMERIC FIBERS. THE PROCESS AND COMPOSITION OF THE PRESENT

INVENTION ARE PARTICULARLY USEFUL IN THE RECYCLING OF THERMOPLASTIC FIBROUS MATERIALS. MATERIALS DECOLORIZED BY THE PROCESS OF THE PRESENT INVENTION MAY BE UTILIZED IN PLACE OF, OR BLENDED WITH, VIRGIN THERMOPLASTICS IN ANY KNOWN THERMOPLASTICS APPLICATIONS INCLUDING EXTRUDING THE MELTED MATERIAL TO FORM FIBER WHICH MAY BE COLORED. IT WAS UNEXPECTEDLY DISCOVERED THAT A DYE OR OTHER COLORANT CAN BE SUBSTANTIALLY REMOVED FROM THE SURFACE OF POLYMERIC MATERIALS, PARTICULARLY FIBERS, BY CONTACTING THE MATERIALS WITH AN ORGANIC ESTER SOLVENT STRIPPING COMPOSITION CONTAINING A CYCLIC ESTER, PARTICULARLY ETHYLENE CARBONATE, PROPYLENE CARBONATE, OR BUTYLENE CARBONATE, AT A TEMPERATURE BELOW THE BOILING TEMPERATURE OF THE ESTER SOLVENT STRIPPING COMPOSITION TO EFFECT THE RELEASE OF DYE OR OTHER COLORANT FROM THE SURFACE OF THE POLYMER. THUS THE PROCESS CAN BE CARRIED OUT AT AMBIENT PRESSURE. U.S. PATENT APPLICATION 10/708,479 (MAULDIN) DISCLOSES THAT POLYESTER POLYMER IS DECOMPOSED WHEN HEATED IN THE PRESENCE OF A CYCLIC ESTER SUCH AS PROPYLENE CARBONATE TO FORM AN ADMIXTURE HAVING UTILITY AS AN INDUSTRIAL SOLVENT. THIS NOVEL SOLVENT COMPOSITION HAS BEEN FOUND TO REMOVE COLORANTS FROM THE SURFACE OF POLYAMIDE POLYMER FIBERS. IN THIS EMBODIMENT OF THE INVENTION, THE COLORED POLYAMIDE FIBERS ARE CONTACTED WITH THE ESTER SOLVENT STRIPPING COMPOSITION AT A TEMPERATURE BETWEEN ABOUT 90 DEGREES CELSIUS AND ABOUT 210 DEGREES CELSIUS. THE PROCESS OF THE PRESENT INVENTION INCLUDES CONTACTING COLORED POLYAMIDE FIBERS WITH AT LEAST ONE ESTER SOLVENT STRIPPING COMPOSITION UNDER CONDITIONS SUFFICIENT

TO EFFECT RELEASE OF COLORANT FROM THE SURFACE OF THE FIBERS. THE PROCESS IS ESPECIALLY USEFUL FOR QUICKLY AND THOROUGHLY REMOVING COLORANTS FROM SURFACE DYED POLYAMIDE FIBERS AS PART OF A RECYCLING PROCESS FOR SUCH FIBERS. COLORANTS ARE CONSIDERED TO BE ANY DYE, PIGMENT OR COLORED COMPOSITION OR COMBINATIONS THEREOF THAT MAY INTENTIONALLY OR ACCIDENTALLY COLOR OR STAIN POLYMERIC MATERIALS, WHILE DYES ARE CONSIDERED TO BE ORGANIC MATERIALS WHICH IMPART COLOR TO A POLYMER AND WHICH BOND TO THE POLYMER SURFACE PRIMARILY BY IONIC MECHANISMS. THE PROCESS OF THE PRESENT INVENTION REMOVES COLORANTS FROM THE SURFACE OF POLYAMIDE FIBERS WITHOUT SUBSTANTIALLY DEGRADING NYLON 6 OR NYLON 6,6 POLYAMIDE POLYMERS, THUS ALLOWING FOR THEIR RECOVERY AND REUSE. IN ONE EMBODIMENT OF THE PRESENT INVENTION, A PROCESS FOR RECYCLING COLORED POLYAMIDE FIBERS COMPRISES THE STEPS OF SHEARING OR CUTTING NYLON 6 OR NYLON 6,6 FACE FIBERS FROM POST CONSUMER CARPET WASTE, THEN CONTACTING THE COLORED POLYAMIDE FIBERS WITH AN ESTER STRIPPING SOLVENT COMPOSITION AT A TEMPERATURE EFFECTIVE TO REMOVE COLORANT FROM THE SURFACE OF THE POLYMERIC MATERIAL. IN ANOTHER EMBODIMENT, A PROCESS FOR RECYCLING COLORED POLYAMIDE FIBERS COMPRISES THE STEPS OF SHREDDING THE ENTIRE CARPET AND GRINDING THE FACE FIBERS AND BACKING COMPONENTS TO YIELD INDIVIDUAL FIBERS COMMINGLED WITH DISCRETE PARTICLES OF BACKING MATERIALS, THEN SEPARATING THE FIBERS FROM THE NON-FIBROUS COMPONENTS BEFORE CONTACTING THE COLORED POLYAMIDE FIBERS WITH AN ESTER STRIPPING SOLVENT COMPOSITION AT A TEMPERATURE EFFECTIVE TO REMOVE COLORANT FROM

THE SURFACE OF THE POLYMERIC MATERIAL. THESE TWO EMBODIMENTS ARE ESPECIALLY USEFUL IN RECYCLING THE SURFACE DYED POLYAMIDE FACE FIBER COMPONENT OF POST-CONSUMER CARPET. ANOTHER EMBODIMENT OF THE PROCESS OF THE PRESENT INVENTION WHICH MAY PERMIT MORE COST-EFFECTIVE RECYCLING OF THE ESTER SOLVENT STRIPPING COMPOSITION USED TO DECOLORIZE COLORED POLYAMIDE MATERIAL COMPRISES: (A) REMOVAL OF COLORANT FROM COLORED POLYAMIDE FIBERS AT AN ELEVATED TEMPERATURE UTILIZING AN ESTER SOLVENT STRIPPING COMPOSITION FURTHER CONTAINING AN ALCOHOL THAT IS IMMISCIBLE IN THE ESTER COMPONENT OF THE ESTER SOLVENT STRIPPING COMPOSITION AT AMBIENT TEMPERATURE; (B) COOLING SAID SOLVENT STRIPPING COMPOSITION TO A TEMPERATURE BETWEEN ABOUT 20 DEGREES AND ABOUT 90 DEGREES CELSIUS TO FORM AN ESTER PHASE AND AN ALCOHOL PHASE CONTAINING COLORANT; AND (C) REMOVING COLORANT FROM THE ALCOHOL PHASE THROUGH FURTHER SEPARATE PROCESSING WHILE THE ESTER PHASE IS IMMEDIATELY AVAILABLE FOR REUSE AS A COMPONENT OF THE ESTER SOLVENT STRIPPING COMPOSITION. IN PRACTICING THE PRESENT INVENTION TO DECOLORIZE THE COLORED POLYMERIC FACE FIBER COMPONENT OF POST CONSUMER CARPET WASTE, THE PROCESS OF DECOLORIZATION SHOULD PREFERABLY BE PRECEDED BY ONE OR MORE OF THE PRELIMINARY STEPS OF (A) PHYSICALLY SEGREGATING CARPET PIECES HAVING NYLON 6, OR NYLON 6,6 FACE FIBERS; (B) CLEANING WASTE CARPET PIECES BY MECHANICALLY SEPARATING DIRT AND OTHER LOOSELY-ATTACHED FOREIGN MATERIALS; (C) CLEANING WASTE CARPET PIECES BY WASHING; (D) SEPARATING NYLON 6 OR NYLON 6,6 FACE FIBERS FROM THE BACKING OF WASTE CARPET BY A

METHOD SELECTED FROM THE GROUP CONSISTING OF MECHANICAL SHEARING, MELT-CUTTING WITH A HOT WIRE, MELT-CUTTING WITH A LASER, AND COMBINATIONS THEREOF; (E) SHREDDING CARPET PIECES FOLLOWED BY GRINDING TO LIBERATE FIBROUS COMPONENTS FROM NON-FIBROUS COMPONENTS AND AIR ELUTRIATION OR OTHER CLASSIFICATION TECHNIQUE TO SEPARATE THE FIBROUS COMPONENTS FROM THE NON-FIBROUS COMPONENTS; AND (F) CUTTING, SHEARING, OR GRINDING THE COLORED FIBERS OBTAINED FROM WASTE CARPET INTO FIBROUS PARTICLES HAVING REDUCED SIZE. THE PRESENT INVENTION HAS A NUMBER OF ADVANTAGES OVER PRIOR ART DECOLORIZATION METHODS. THE PRESENT INVENTION DOES NOT SUBSTANTIALLY DEGRADE THE POLYMER AND THEREFORE RECOVERED POLYMER CAN BE USED IN NEW POLYMERIC MATERIALS OR ARTICLES IN PLACE OF VIRGIN POLYMER. WHEN LADEN WITH COLORANTS THE SOLVENT STRIPPING COMPOSITIONS OF THE PRESENT INVENTION CAN BE REMOVED FROM THE POLYMER WITH RELATIVE EASE BECAUSE THE STRIPPING AGENT DOES NOT PENETRATE INTO THE FIBERS AND DISRUPT THE MOLECULAR FORCES WITHIN THE POLYMER MATRIX SUFFICIENTLY TO RESULT IN AN OPENING OF THE POLYMER STRUCTURE. COLORANTS SOLUBLE IN THE SOLVENT STRIPPING COMPOSITIONS OF THE PRESENT INVENTION AT ELEVATED TEMPERATURES CAN OFTEN BE PRECIPITATED FROM THE COMPOSITIONS UPON COOLING.

[0002]

DETAILED DESCRIPTION THE PROCESS OF THE PRESENT INVENTION INCLUDES CONTACTING COLORED POLYMERIC MATERIALS WITH AT LEAST ONE ESTER SOLVENT STRIPPING COMPOSITION UNDER ELEVATED

TEMPERATURE CONDITIONS SO AS TO EFFECT THE RELEASE OF A DYE OR OTHER COLORANT FROM THE SURFACE OF THE POLYMERIC MATERIAL. THE AMOUNT OF THE ESTER SOLVENT STRIPPING COMPOSITION AND THE CONDITIONS UNDER WHICH THE CONTACTING TAKES PLACE ARE SELECTED SO THAT THE POLYMERIC MATERIAL DOES NOT UNDERGO SUBSTANTIAL DESTRUCTION OR DEGRADATION. THE CONTACTING STEP IS MOST PREFERABLY PERFORMED AT AMBIENT PRESSURE. A PREFERRED PRACTICE OF THIS INVENTION UTILIZES THE TEMPERATURE DEPENDENCE OF THE SOLUBILITY OF DYES IN THE ESTER SOLVENT STRIPPING COMPOSITIONS TO EFFECT SEPARATION OF DYES FROM THE ESTER SOLVENT STRIPPING COMPOSITIONS. AT LEAST A PORTION OF COLORANTS ARE PREFERABLY REMOVED AS PARTICULATE PRECIPITATES, THUS ALLOWING COST-EFFECTIVE RECYCLING OF THE ESTER SOLVENT STRIPPING COMPOSITIONS. RESIDUAL DISSOLVED DYES OR OTHER COLORANTS CAN BE REMOVED FROM THE ESTER SOLVENT STRIPPING COMPOSITIONS OF THE PRESENT INVENTION BY PRIOR ART TECHNIQUES SUCH AS ADSORPTION, CHEMICAL TRANSFORMATION INTO LESS SOLUBLE CHEMICAL SPECIES, CHEMICAL DESTRUCTION, OR ELECTROLYTIC COAGULATION. THE RESIDENCE TIME FOR CONTACTING THE COLORED POLYMERIC MATERIAL WITH AN ESTER SOLVENT STRIPPING COMPOSITION DURING THE CONTACTING STEP MAY BE CONTROLLED TO ENSURE THE DESIRED DEGREE OF COLOR REMOVAL. SUITABLE RESIDENCE TIMES FOR THE CONTACTING STEP WILL DEPEND UPON THE CONDITIONS OF THE CONTACTING STEP. THE PREFERRED RESIDENCE TIME IS NO GREATER THAN ABOUT 20 MINUTES, MORE PREFERABLY NO GREATER THAN ABOUT 10 MINUTES. THE CONTACTING STEP IN THESE EMBODIMENTS MAY INCLUDE A PLURALITY OF CONTACTING STAGES

WHEREIN THE COLORED POLYMERIC MATERIAL IS CONTACTED WITH AN ESTER SOLVENT STRIPPING COMPOSITION AT EACH STAGE. ONE SKILLED IN THE ART WOULD APPRECIATE THAT THE RESIDENCE TIME VARIES DEPENDING UPON THE TEMPERATURE AND OTHER CONDITIONS IN ORDER TO ACHIEVE THE RESULTS OF THE PRESENT INVENTION. THE PROCESS OF THE PRESENT INVENTION MAY FURTHER INCLUDE A WASHING STEP, WHEREIN ANY RESIDUAL DYE, COLORANT, OR ESTER SOLVENT STRIPPING COMPOSITION IS REMOVED. SUITABLE WASHING AGENTS SHOULD AT LEAST PARTIALLY SOLUBILIZE RESIDUAL DYE, COLORANT OR ESTER SOLVENT STRIPPING COMPOSITION WITHOUT HARMING THE DECOLORIZED POLYMERIC MATERIAL. WASHING AGENTS SHOULD PREFERABLY BE POLAR ONE OR MORE POLAR LIQUIDS. WATER, CYCLIC ESTERS SUCH AS PROPYLENE CARBONATE OR ETHYLENE CARBONATE, C.SUB.1 TO C.SUB.4 ALIPHATIC ALCOHOLS, AND MIXTURES THEREOF MAY BE USED. AN AFTER TREATMENT WASH WITH AN AQUEOUS 0.1% TO 0.3% SODIUM HYDROSULFITE SOLUTION MAY ALSO BE EMPLOYED TO ENHANCE FINAL POLYMER COLOR. THE CONTACTING STEP MAY BE PERFORMED USING A VARIETY OF TECHNIQUES THAT WILL BE APPARENT TO ONE OF ORDINARY SKILL IN THE ART. SUCH TECHNIQUES INCLUDE IMMERSING THE COLORED POLYMERIC MATERIAL IN THE ESTER SOLVENT STRIPPING COMPOSITION, SPRAYING AN EFFECTIVE AMOUNT OF ESTER SOLVENT STRIPPING COMPOSITION ONTO THE POLYMERIC MATERIAL, AND OTHER SIMILAR SUCH TECHNIQUES. FURTHER THE CONTACTING STEP MAY BE CARRIED OUT IN LOTS IN A BATCH-WISE MANNER OR IT MAY BE CARRIED OUT IN A CONTINUOUS MANNER. IN AN ESPECIALLY PREFERRED EMBODIMENT, DYED NYLON FIBER IS CONTACTED WITH THE SOLVENT COMPOSITION DISCLOSED IN U.S. PATENT APPLICATION 10/708,479

AULDIN) AT A TEMPERATURE OF AT LEAST ABOUT 130 DEGREES CELSIUS FOR A PERIOD OF UP TO ABOUT 10 MINUTES. A SERIES OF TWO OR THREE SEQUENTIAL TREATMENTS CAN BE EMPLOYED TO IMPROVE THE FINAL POLYMER PRODUCT COLOR. AS WILL BE APPARENT TO ONE SKILLED IN THE ART, THE COMBINED EFFECT OF TEMPERATURE AND THE FORMULATION OF A SUITABLE CONTACTING COMPOSITION CAN BE USED TO CONTROL THE PROCESSES OF THE PRESENT INVENTION. THUS VARIATION AND OPTIMIZATION OF THE CONTACTING COMPOSITION, AND THE TEMPERATURE, TIME, AND REPETITION CONDITIONS OF THE CONTACTING PROCESS IN ORDER TO MAXIMIZE THE DECOLORIZING EFFECT OF THE CONTACTING COMPOSITION ARE CONSIDERED TO BE WITHIN THE SCOPE OF THE PRESENT INVENTION. IT SHOULD BE NOTED THAT SINCE THE PROCESS IS MOST PREFERABLY CONDUCTED AT AMBIENT PRESSURE, ESTER SOLVENT STRIPPING COMPOSITIONS CONTAINING ESTERS AND ALCOHOLS THAT BOIL AT RELATIVELY HIGH TEMPERATURES ARE PREFERRED. THE FOLLOWING EXAMPLES ARE INCLUDED TO DEMONSTRATE PREFERRED EMBODIMENTS OF THE INVENTION. THOSE SKILLED IN THE ART SHOULD, IN LIGHT OF THE PRESENT DISCLOSURE, APPRECIATE THAT MANY CHANGES CAN BE MADE IN THE SPECIFIC EMBODIMENTS WHICH ARE DISCLOSED AND STILL OBTAIN A LIKE OR SIMILAR RESULT WITHOUT DEPARTING FROM THE SPIRIT AND SCOPE OF THE INVENTION.

EXAMPLE 1 A DEEP RED SURFACE-DYED NYLON 6 YARN WAS CUT INTO ABOUT 1 INCH LENGTHS AND 10 GRAMS OF THE YARN WAS PLACED INTO AN ERLLENMEYER FLASK WITH 100 GRAMS OF A SOLVENT COMPOSITION PREPARED BY ADMIXING 100 GRAMS OF PROPYLENE CARBONATE WITH 20 GRAMS OF POLY(ETHYLENE TEREPHTHALATE) YARN AND HEATING THE ADMIXTURE TO 230 DEGREES CELSIUS FOR 15 MINUTES.

THE NYLON 6 YARN PIECES WERE IMMERSSED IN THE ESTER SOLVENT COMPOSITION, HEATED TO A TEMPERATURE OF 160 DEGREES CELSIUS, WHEREUPON SOLVENT WAS SEPARATED FROM THE NYLON 6 FIBERS BY FILTRATION. THE NYLON 6 YARN PIECES WERE VISIBLY LIGHTER IN COLOR AND THE ESTER SOLVENT COMPOSITION WAS OBSERVED HAVE A STRONG RED COLOR. **EXAMPLE 2** COLORED NYLON 6,6 CARPET FIBERS RECOVERED FROM POST-RESIDENTIAL CARPET WASTE WERE OBTAINED FROM A COMMERCIAL BROKER OF RECYCLED THERMOPLASTIC MATERIALS. TEN GRAMS OF THESE FIBERS WERE SELECTED TO DISPLAY AT LEAST FOUR DISTINCT COLORS INCLUDING RED, BLUE, BEIGE, AND BROWN; THE FIBERS WERE PLACED INTO AN ERLLENMEYER FLASK WITH 100 GRAMS OF SOLVENT COMPOSED OF 70 GRAMS OF PROPYLENE CARBONATE AND 30 GRAMS OF "SOYGOLD 1000" METHYL ESTER OF SOYBEAN OIL. THE FIBERS WERE IMMERSSED IN THE ESTER SOLVENT AND HEATED TO A TEMPERATURE OF 200 DEGREES CELSIUS, WHEREUPON SOLVENT WAS SEPARATED FROM THE NYLON 6,6 FIBERS BY CENTRIFUGATION. THE FIBERS HAD ASSUMED A UNIFORM LIGHT GRAY APPEARANCE WHILE THE ESTER SOLVENT COMPOSITION WAS OBSERVED TO HAVE A BROWN COLORATION. **EXAMPLE 3** SURFACE-DYED NYLON 6 CARPET FIBERS WERE RECOVERED FROM INDUSTRIAL COMMERCIAL CARPET WASTE. THE FIBERS WERE DEEP BLUE IN COLOR. TEN GRAMS OF THESE FIBERS WERE PLACED INTO AN ERLLENMEYER FLASK WITH 100 GRAMS OF SOLVENT COMPOSED OF 80 GRAMS OF PROPYLENE CARBONATE AND 20 GRAMS OF 2-OCTANOL. THE FIBERS WERE IMMERSSED IN THE SOLVENT AND HEATED TO A TEMPERATURE OF 130 DEGREES CELSIUS, WHEREUPON SOLVENT WAS SEPARATED FROM THE NYLON 6 FIBERS BY FILTRATION. THE FIBERS HAD ASSUMED AN OFF-WHITE

COLOR. THE SOLVENT WAS OBSERVED TO HAVE A BLUE COLOR. UPON COOLING BELOW 55 DEGREES CELSIUS, THE SOLVENT SEPARATED INTO 2 LIQUID PHASES WITH THE GREATEST VOLUME REPRESENTED BY THE DENSER PROPYLENE CARBONATE PHASE. THE 2-OCTANOL PHASE WAS OBSERVED TO HAVE A SUBSTANTIALLY DARKER BLUE COLOR THAN THE PROPYLENE CARBONATE PHASE. WHILE THE COMPOSITIONS AND METHODS OF THIS INVENTION HAVE BEEN DESCRIBED IN TERMS OF PREFERRED EMBODIMENTS, THE PRESENT INVENTION MAY BE EMBODIED IN OTHER SPECIFIC FORMS WITHOUT DEPARTING FROM THE SPIRIT OR ESSENTIAL ATTRIBUTES THEREOF, AND ACCORDINGLY, REFERENCE SHOULD BE MADE TO THE APPENDED CLAIMS, RATHER THAN TO THE FOREGOING SPECIFICATION, AS INDICATING THE SCOPE OF THE INVENTION.
